The very basics of creating a logo are fairly simple. You are simply creating a shape that is associated with a company. At this point you will want to make sure the image is professional and crisp. A great way to do this is to use the zoom in to 100% so that the image is printed as large as possible. Then change the color to black and white and look at the edges. You will find that there is

quite a bit of bleed that is not perfect. To fix this simply select the Selection Tool and erase any unwanted parts of the image. You will also want to use the content aware fill feature of Photoshop to add an all around layer of the background text to the image using the same black and white / white and black colors. Now you can either add some gradients, shapes, or even drop shadows on the logo. If you really want to spice things up, you can create a vector logo. To do this, simply zoom in to 75% on your image and make sure the resolution is set to 300 dpi. Duplicate the layer and change the blend mode to 'Multiply'. This will allow you to increase the size of the left side of your logo. You can add a gradient by selecting the top layer and choosing New > Gradient. From there you can go to the color wheel and adjust the colors around the left side of your logo. When you click 'OK', the gradient will be applied. **What It Does:** The Clone Stamp tool allows users to remove marks and spots from photographs. This tool could be used for selecting areas in a photo and for removing an area in which unwanted marks appear. e3d0a04c9c

You can use the Healing feature to create sharper edges or to repair images that have suffered from compression. You can choose which controls are available and customize your interface to match your workflow. For example, you can hide the icons or organize them in a different manner. The new amass function lets you store presets in the image so you don't need to re-enter your settings each time you use a tool on the image. The function can be used for both layers and smart objects. Moreover, the function has become a more reliable way of removing unwanted objects. A new feature called 'Lens Correction', provides more information about the lens that you're using, such as the lens type, focal length and aperture. This facilitates faster, real-time performances and the automated removal of particular types of lens artifacts, says Adobe. Adobe is stepping up its AI tools and has upgraded 'AI Drive.' The new Drive tools include Auto Drive, which uses the photographer's existing rules to create new presets automatically for the most common photographic scenarios. In addition, the new Drive tools include Auto Gain and Auto HDR. Adobe has added a new feature called 'Auto-Leveling,' which "automatically levels images with the help of a computer vision-based technology for a consistent level of brightness across an image." The new feature is made possible thanks to the new Luminance HDR toolset, which helps you isolate the brightest and darkest areas of your images, and does away with the tedious task of finding and correcting dof. Adobe's latest Photoshop update brings its most honest update yet. When editing a photo, the software now has a new "Honest Rating" that helps you make more resilient decisions, follow your intuition and avoid huge mistakes.
